TABLE OF CONTENTS

INTRODUCTION

The purpose of the Uniform Soybean Tests is to critically evaluate the best of the experimental soybean lines developed by federal and state research personnel in the U.S. and Canada, for their potential as new varieties.

A test is established for each of ten maturity groups. Uniform Test 00 includes maturity Group 00 strains for the northern fringe of the present area of soybean production. Uniform Tests 0 through IV include later strains adapted to locations progressively farther south in the North Central States and areas of similar latitude. Each year new selections are added and others that have been sufficiently tested are dropped. The summary of performance of strains in Uniform Tests 00 through IV in the northern states is included in this report. The report on Uniform Tests IVS through VIII in the southern states is issued separately.

Data from the Uniform Tests form the basis for decisions on the regional release of soybean varieties. Preliminary Tests are grown at a limited number of locations throughout the region to screen the experimental strains for maturity and general agronomic performance for one year before they are entered in the Uniform Tests.

Unreleased strains in this report are not available for general distribution. For further information on them contact the originating agencies listed on Page 6.

STRAIN DESIGNATION

Experimental (i.e., unreleased) strains are identified by a number with a code letter prefix. The code letters have been agreed upon in meetings of experiment station agronomists cooperating with the U.S. Regional Soybean Laboratory. They indicate the location of the originating agencies as follows:

A	Iowa A.E.S.
Ar	Arizona A.E.S.
Au	Alabama A.E.S.
B	California
C	Purdue (Indiana) A.E.S.
CM	Canada Dept. of Agriculture, Morden, Manitoba
D	Mississippi A.E.S.
E	Michigan A.E.S.
F	Florida A.E.S.
FC	Forage and Range Research Branch, U.S.D.A.
Ga	Georgia A.E.S.
H	Ohio A.R.D.C.
K	Kansas A.E.S.
L	Illinois A.E.S.
La	Louisiana A.E.S.
M	Minnesota A.E.S.
Md	Maryland A.E.S.
Me	Maine A.E.S.
N	North Carolina A.E.S.
ND	North Dakota A.E.S.
O	Central Experiment Farm, Ottawa, Ontario
O	Research Station, Harrow, Ontario
OAC	University of Guelph, Guelph, Ontario
Ok	Oklahoma A.E.S.
PI	Plant Introduction, Germplasm Resources Laboratory, U.S.D.A., Beltsville, I
R	Arkansas A.E.S.
S	Missouri A.E.S.
SC	South Carolina A.E.S.
SD	South Dakota A.E.S.
SL	Two or more states cooperatively
Ts	Texas A.E.S.
T	Soybean Genetic Type Collection, U.S.R.L.
U	Nebraska A.E.S.
UD	Delaware A.E.S.
UM	University of Manitoba, Winnipeg, Manitoba
UT	Tennessee A.E.S.
V	Virginia A.E.S.
W	Wisconsin A.E.S.

Uniform Tests are usually planted in four-row plots with three replications or three-row plots with four replications and the center one or two rows are harvested. Preliminary Tests are usually planted in three-row plots (the center row harvested) with two replications. More rows are desirable where unusually narrow (under 30 inch) row spacing is used. Usually 18 to 20 feet of row are planted and 16 feet harvested, to eliminate end-of-row effects. Seeds are packeted at approximately 180 viable seeds per packet for each row.

Parentage. Parent strains other than named varieties are identified on page 12.

Generation Composited is the generation after the final single-plant selection.

Previous Testing. The number of previous years in the same Uniform Test is given, or, in the case of new entries, a reference to last year's test abbreviated UT 0 for Uniform Test 0, PT III for Preliminary Test III, etc.

Yield is measured after the seeds have been dried to a uniform moisture content and is recorded in bushels (60 pounds) per acre. (To convert to kilograms per are (or quintals per hectare) multiply by .6725; 1 kg/are = 1.487 bu/acre.)

Maturity is the date when 95% of the pods have ripened. Delayed leaf drop and green stems are not considered in assigning maturity. Maturity is expressed as days earlier (-) or later (+) than the average date of the reference variety. To aid in maturity group classification, one earlier and one later "tie" variety are given on the maturity table for each test. Current reference and tie varieties and the maturity group limits relative to the reference varieties are:

Group	Reference	Range	Early Tie	Late Tie
00	Portage	-2 to +6		Clay (0)
0	Swift	-5 to +3	Altona (00)	Steele (I)
I	Steele	-3 to +5	Swift (0)	Corsoy (II)
II	Corsoy	-3 to +5	Hark (I)	Wayne (III)
III	Wayne	-4 to +4	Beeson (II)	Cutler 71 (IV)
IV	Cutler 71	-4 to +7	Williams (III)	Essex (V)

These maturity group ranges are based on long-time means over many locations. When using data from other environments, the interval between reference varieties may vary, and the division between maturity groups should be estimated in proportion to the above figures.

Lodging is rated at maturity according to the following scores:

1 Almost all plants erect
2 All plants leaning slightly or a few plants down
3 All plants leaning moderately (45°), or 25% to 50% of the plants down
4 All plants leaning considerably, or 50% to 80% of the plants down
5 Almost all plants down

Height is the average length in inches of plants from the ground to the tip of the main stem at the time of maturity. (To convert to centimeters, multiply by 2.54.)

Seed Quality is rated according to the following scores considering the amount and degree of wrinkling, defective seed cost (growth cracks), greenishness, and moldy or rotten seeds. (Threshing or handling damage is not considered, nor is mottling or other pigment.)

1 Very Good 2 Good 3 Fair 4 Poor 5 Very Poor

Seed Size (i.e. weight per seed) in grams per 100 based on a 100 or 200 seed sample. (To convert to seeds per pound divide this into 45,359.2).

Seed Composition is measured on samples submitted to the Laboratory. A 60 to 70-gram sample of clean seeds is prepared by taking an equal volume or weight of seeds from each replication. Protein and oil percentages are measured using Infrared reflectance.

Descriptive Code: 1234 567, abbreviated as underlined below:

1 = Flower Color: Purple, White
2 = Pubescence Color: Tawny, Gray, Light tawny
3 = Pubescence Type: Normal, Appressed, Semi-appressed
4 = Pod Color: Brown, Tan
5 = Seed Coat Luster: Dull, Shiny, Intermediate
6 = Seed Coat Color: Yellow, Gray, Light gray, Green
7 = Hilum Color: Black, Imperfect black, Brown, Buff, Gray, Tan, Yellow; prefixes indicate Light or Dark shades, e.g., Lbf = light buff, Dib = dark imperfect black.

Peroxidase Activity: H = High, L = low activity in seed coat.

Fluorescent Light Response: E = early flowering (about 35 days), L = late flowering (about 70 days) under 20 hour cool white fluorescent photoperiod.

Shattering is scored at a specified time after maturity and is based on estimates of the percent of open pods as follows:

1 No shattering
2 1% to 10% shattered
3 10% to 25% shattered
4 25% to 50% shattered
5 Over 50% shattered

Iron Chlorosis is rated from 1, no chlorosis, to 5, severe chlorosis.

Emergence Score is related to Hypocotyl elongation and was measured at Ames, Iowa, on germination at 25°C (a critical temperature for differentiating strains).

Disease reactions are listed according to "Soybean Disease Survey Standards", March 1960, unless otherwise specified. Disease reaction is scored from 1 (no disease) to 5 (very severe), or in some cases as percent infected or simply as + (present) or o (absent). Purple seed stain, pod and stem blight and seed mottling follow the disease severity class rating:

Disease severity class rating	1	2	3	4	5
Number of diseased seed in sample	0	1-3%	4-8%	9-19%	20-100%

An additional classification to describe the extent of seedcoat mottling as M (mild), E (extensive), or S (severe), is included. The location where the test was made is identified in the column heading, and the letter "a" or "n" signifies artificial or natural infection. Clearcut and consistent reactions are given by letter instead of number: R=resistant, S=susceptible, I=intermediate, and H=heterogeneous. Natural infection ratings are from agronomic tests in some instances and from special disease planting in others. Absence of symptoms under natural infection does not necessarily mean high resistance.

Abbreviation	Disease	Pathogen
BB	Bacterial blight	Pseudomonas glycinea
BBV	Bud blight	Tobacco ringspot virus
BP	Bacterial pustule	Xanthomonas phaseoli var. sojensis
BS	Brown spot	Septoria glycines
BSR	Brown stem rot	Cephalosporium gregatum
CN	Cyst nematode	Heterodera glycines
CR	Charcoal rot	Macrophomina phaseoli
DM	Downy mildew	Peronospora manshurica
FE_1, FE_2	Frogeye race 1, 2	Cercospora sojina
PM	Powdery mildew	Microsphaera diffusa
PR	Phytophthora rot	Phytophthora sojae
PS	Purple stain	Cercospora kikuchii
PSB	Pod and stem blight	Diaporthe phaseolorum var. sojae
Pyd	Pythium root rot	Pythium debaryanum
Pyu	Pythium root rot	Pythium ultimum
RK	Root knot nematode	Meloidogyne spp.
RR	Rhizoctonia root rot	Rhizoctonia solani
SB	Sclerotial blight	Sclerotium rolfsii
SC	Stem canker	Diaporthe phaseolorum var caulivora
SMV	Soybean mosaic	Soja virus 1
TS	Target spot	Corynespora cassiicola
WF	Wildfire	Pseudomonas tabaci
YMV	Yellow mosaic	Phaseolus virus 2

Ratings for BB, BP, BS, DM, FE_2, and PM, were based on leaf symptoms; those for BSR on percent of plants with stem browning, or percent of stem length browned, and those for PR on seedling rotting and/or stunting.

Additional data on seed quality is included under the section: Seed Quality Data for Uniform Test Entries, Pages 126-130.

5. M65-217	M433(Acme x Chippewa) x Hark	1	"

*Number of years in this test.

Regional data for the past 10 years shows that the varieties Altona, Norman, and Portage are very similar in yield and differ in maturity by about 5 days. Tests over the past 3 years have shown that M64-105 is similar in yield to the check varieties and is about the same maturity as Altona. During the past 2 years the entry M65-217 has been considerably higher in yield than the other entries in the test and has very good lodging resistance. However, it is susceptible to phytophthora root rot.

*Number of years in this test or name of 1973 test.

The regional 5-year mean shows that Evans is higher yielding and has better seed quality than either Clay or Swift. Two-year test data does not show any distinct advantage of M64-157 or M65-94 over the check varieties.

Three entries were new in the test this year, M65-207, M65-270, and M65-295. None of them show any superiority over the check varieties or over previous entries in the test, and all are susceptible to phytophthora root rot.

8. SD73-11	Colchicine treated Renville	F_{11}
9. SD73-13	(Adams x Capital) x Blackhawk	F_7

None of the new strains show any yield advantage over Swift. Two entries, M68-2 and M68-37, are equal to Swift in yield and the entry M66-18 is nearly as early but shows no yield advantage over Clay. All four Minnesota strains have good lodging resistance. Entries M68-37, SD73-10, SD73-11 have as good shattering resistance as Clay. The entries M68-2 and M68-37, which show some promise, are resistant to Phytophthora root rot. It appears as though an error has been made in the parentage of strains SD73-10 and SD73-11. Both are resistant to Phytophthora root rot, yet all the parents of these strains are susceptible to this disease.

*Number of years in test or name of 1973 test.

Regional data for the past 3 years shows that the variety Hodgson which is 5 days earlier than Hark in maturity is 2 bushels higher yielding. Hodgson is similar in maturity to Steele and is 3.5 bushels higher yielding. However, it is susceptible to phytophthora root rot. Hodgson averaged 1.6% higher in oil and was only moderately lower in protein.

During the past 2 years none of the strains showed any yield advantage over Hodgson but M65-69, M65-115, and M65-122 showed a 1 to 2 bushel yield advantage over Hark and Steele. The strain OX643 was lowest yielding, was 4 days earlier in maturity than Steele, and is phytophthora root rot resistant. The strains M65-115 and M65-122 have higher oil contents than other strains in the test.

The five new entries in 1974 showed no distinct advantage over Hodgson for any characteristic evaluated.

The 18 A entries have five strains: A73-128, A73-19068, A73-19084, A73-20059, and A73D16 which have a regional mean yield equal to Hark, or two bushels better than Hark. The five strains are one to two days earlier maturing than Hark and of these, A73-19068 and A73-19084 are Phytophthora root rot resistant. In the test, A73-19084 had the highest mean yield.

The strains M68-48 and M68-49 are Phytophthora root rot resistant and are slightly better yielding than Hark. The strain M68-49 has very good lodging resistance and is five days earlier than Hark, has high oil content, but is low in protein.

* Number of years in test or name of 1973 test.

The six year regional mean for the four check varieties shows less than a bushel difference in yield, although Corsoy and Wells are three to four days earlier in maturity than Amsoy 71 and Beeson. Wells is outstanding in lodging resistance and is slightly higher in protein. Corsoy is susceptible to Phytophthora root rot.

The strain OX-271 is the highest yielding in the 1974 test, is the same maturity as Wells, and is Phytophthora root rot resistant. The other strains; A72-522, A72-523, and L70D6-16 are four to six days later than Corsoy in maturity. The strains A72-522 and A72-523 are Phytophthora root rot susceptible, and this disease severely reduced the yield of these strains at some test locations causing their regional mean yield to be low in this test. Where Phytophthora root rot is not a factor, they have good yield potential.

Of the 34 strains in the 1974 test, only A73-25050 and A73-229 were higher yielding than both check varieties in regional mean yield, but they were almost one day later than Beeson and four days later than Corsoy. Both strains are susceptable to Phytophthora root rot. The strain A73-25050 has moderate shattering resistance and A73-229 has poor shattering resistance. There are several strains which are intermediate between Beeson and Corsoy for mean yield and maturity, but show no distinct advantage over Beeson in any characteristic evaluated.

PRELIMINARY TEST II, 1974

* Number of years in test or name of 1973 test.

The 5-year Central mean shows that Woodworth and Williams are equal in yield and superior to both Calland and Wayne. Woodworth is 3.5 days earlier than Williams, and in other characteristics these two varieties are very similar.

In the 2-year Central mean, SL11 (BC Wayne with resistance to downy mildew, and Phytophthora root rot) and C1508 are two bushel lower yielding than Woodworth and have the same maturity as Woodworth. C1508 also has excellent lodging resistance.

In the 1974 Central mean, the strain L70T-543 is one-bushel better in yield and is three days earlier in maturity than Woodworth. However, it does not have as good lodging resistance as Woodworth. The strain L70T-543 is Phytophthora root rot resistant and where Phytophthora rot was a factor, it was noticeably superior in yield. It was segregating for pubescence and hilum color. The remaining seven new entries showed no distinct advantage over Woodworth for any characteristic evaluated.

The 2-year East Coast mean shows C1508 to be slightly superior in yield, has the same maturity and better lodging resistance than Woodworth. C1508 is also Phytophthora root rot resistant.

The 1974 East Coast results showed that yields of L70T-543 and C1508 were equal and slightly below the yield of Woodworth. L70T-543 matures one day earlier than C1508 and Woodworth. The seven other entries do not appear to have any distinct advantage over the check varieties.

This test has several strains outyielding the checks. Of these, A73-12013, and L70D6-11-5 matured three days earlier than Wayne and had good to excellent lodging resistance. Several other strain were three to four days later in maturity and higher yielding than Wayne and should merit further testing.

* Number of years in test or name of 1973 test.

In the 5-year Central mean the strain L66-1359 had a mean yield two bushels better, and had the same maturity as Bonus. L66-1359 is lower in Protein than Bonus and is Phytophthora root rot susceptable.

The 2-year Central mean again shows L66-1359 the best yielding. The strain L70-4180 is equal in yield to Bonus and is four days later in maturity than Bonus.

The strain A72-512 is the highest yielding in the Central 1974 test, and matures 1.5 days earlier than Cutler 71, but is not as lodging resistant as most other entries in the test. Two other new strains to the 1974 test, L70L-2947 and L70L-2912 were slightly higher yielding than Cutler 71, were two to four days earlier maturing, and were similar to Cutler 71 in most other characteristics. Pomona, four days later than Cutler 71, may have had its yield reduced at most locations due to the early frost.

The 1974 East Coast mean shows the strain A72-512 superior to the checks in yield. The strains A72-511, L66-1359, and L70L-2947 are also higher yielding than the checks with A72-511, and L66-1359 having good lodging resistance and L70L-2947 being resistant to Phytophthora root rot.

The mean of the eleven locations shows C1520 to be three bushels better yielding, and maturing 1½ days earlier than Cutler 71. The strains C1518, L71L,554, L71L,556, and L72A-89 outyielded Cutler 71 and were from one day earlier to two days later than Cutler 71 in maturity. L71L-554 and L71L-556 had 44.0 and 43.3 percent protein respectively. The strain L71L-554 is heterogenous and L71L-556 is resistant to Phythophthora root rot. Both strains carry resistance to Bacterial pustule and Frogeye race 2.

An early frost may have cut the yields of some of the later strains at some locations in the test.
