

# Facilitating Cheatgrass (*Bromus tectorum*) Fuels Reduction: What Defines a Resistant Plant Community

Managing cheatgrass to prevent habitat loss is critical for the survival of native plants, wildlife and sustainable livestock grazing practices.

The best means to suppress cheatgrass is the presence of a long-lived perennial grass.

## Rehabilitation and Drill Seeding

### Treatments:

**A)** Seed mix 1) Native perennial grass only mix vs. 2) Introduced Perennial grass seed mix

**B)** Pre-seeding cheatgrass control 1) herbicide fallow vs. 2) fire

### Response variables:

Perennial grass density & Cheatgrass density & Fuel

## The Effect of Litter on Cheatgrass Suppression

3 replicated suppression sites

### Treatments:

**A)** Perennial grass intact

**B)** Perennial grass intact & 2,000lbs/acre litter added

**C)** Perennial grass removed (glyphosate)

### Response variables:

Cheatgrass density

## Perennial Grass Competition for Soil Moisture and Nitrogen

(mechanisms for suppression)

### Treatments:

Perennial Grass Species

### Response Variables:

Gravimetric soil moisture & ppm soil NO<sub>3</sub><sup>-</sup>

### Methods:

At monthly intervals, gravimetric soil moisture and ppm NO<sub>3</sub><sup>-</sup> were measured at 2 depths (4-6" and 14-18") in each replicated plot (3) for each perennial grass species (9). 1 plot\* = 28 plants of individual species (4 x 7 plants 1ft spacing)

Treatment	Species	Rate lbs/acre
Introduced Mix	'Hycrest' crested wheatgrass ( <i>Agropyron cristatum</i> )	4
	Siberian wheatgrass ( <i>Agropyron fragile</i> )	4
Native Mix	'Anatone' bluebunch wheatgrass ( <i>Pseudoroegneria spicata</i> )	6
	Sherman big bluegrass ( <i>Poa secunda</i> )	2
	Sandberg bluegrass ( <i>Poa secunda</i> )	2

A1) B1)	Per. Grass	3.3 plants/ ft <sup>2</sup>
	Cheatgrass	1.7 plants /ft <sup>2</sup>
	Cheatgrass fuel	135 lbs/acre

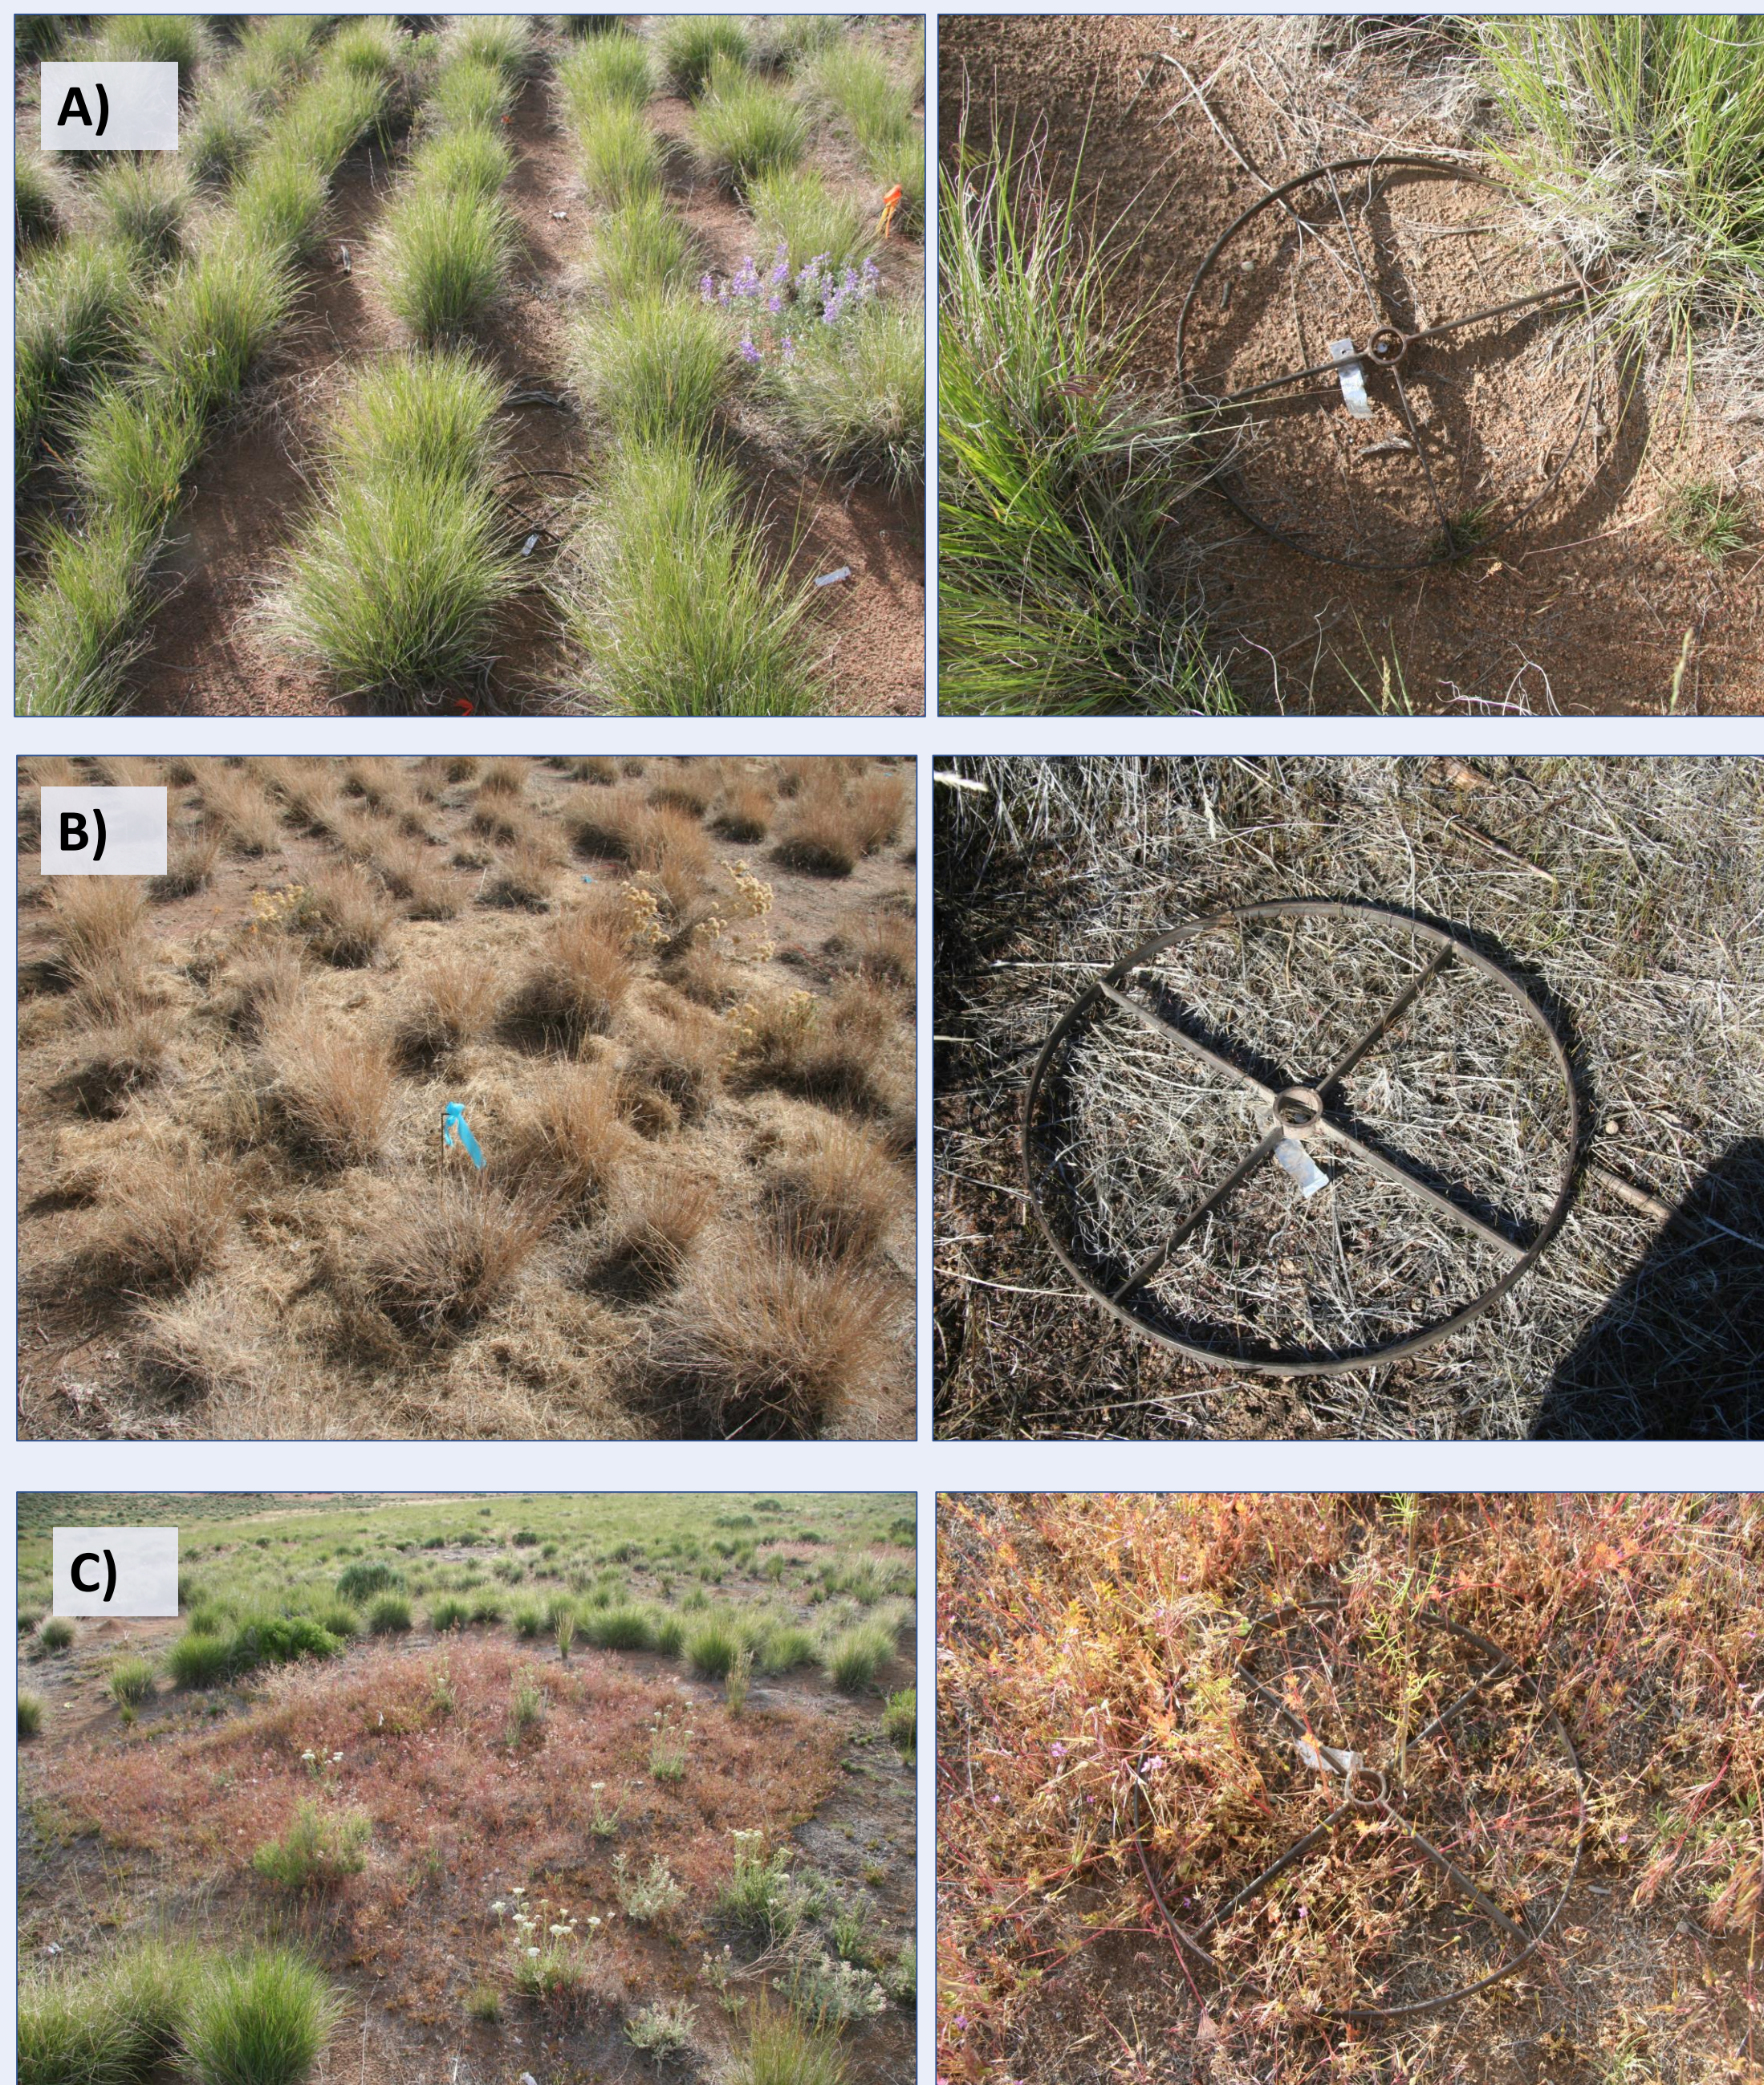

A1) B2)	Per. Grass	2.1 plants/ ft <sup>2</sup>
	Cheatgrass	7.4 plants /ft <sup>2</sup>
	Cheatgrass fuel	895 lbs/acre

Native Seed Mix

A2) B1)	Per. Grass	3.3 plants/ ft <sup>2</sup>
	Cheatgrass	1 plants /ft <sup>2</sup>
	Cheatgrass fuel	92 lbs/acre

A2) B2)	Per. Grass	2.3 plants/ ft <sup>2</sup>
	Cheatgrass	3.3 plants /ft <sup>2</sup>
	Cheatgrass fuel	362 lbs/acre

Non-Native Seed Mix

Treatment	Cheatgrass density plants/ft <sup>2</sup>		
	Site 1	Site 2	Site 3
A	15.1	4.9	2.4
B	32.0	6.4	7.9
C	31.6	9.4	10.5

## Summary

Competition for resources is the means by which resistance can be defined. In order to facilitate resistance, perennial plants must have the potential to establish, persist and effectively compete for resources. While non-native grasses have the greatest establishment potential, if establishment can be achieved, native grasses such as bluebunch wheatgrass can be effective at suppression. Many native grasses are unlikely to be as effective at suppression. Using grazing to reduce fuels (litter) will increase cheatgrass suppression potential.
