On the production call yesterday, I failed to mention an industry need to develop a rapid and economical system for sampling pond inventories and yielding a size distribution histogram for harvest planning and plant scheduling. This same system may be used in some manor to aid in securing aquaculture crop insurance with feed records for potential volumes. There is a company in Canada called Xpert solutions that supposedly take a sample of fry and place in bucket with their camera and software system and product head count/size histogram. There is also some Norwegion company that can install camera and net chutes underwater and generate size histogram in open salmon net pens?
