

Peter M. H. Heegaard

The research focus is on innate immunology of veterinary animals, including the basic biology of innate host responses to infection and animal models (especially pig models) on inflammation. The work also includes new types of diagnostic assays for early detection of infection and for objective evaluation of animal welfare as well as work on synthetic immunomodulators and collaborative work on host defense peptidomimetics. Recent projects include investigations on cost-efficient immunoglobulin based methods for prevention and treatment of common infections in livestock.
